Quick source and destination setup The application can be used to either encode, and decode files in order to grab watermark data. No extra components are required, and you're free to take it for a spin from the moment download is done. The main window only holds necessary controls to trigger one of the two processes, as well as a detailed description box to point out what needs to be done. Choosing to encode a file brings up a separate panel with all controls. WAV files are the only supported ones, which need to be added through the browse dialog. You're only able to work on one file at a time. Output field is automatically filled in, but you can easily change it if you want the new file to be saved in a different location. Encode with public, or private layers The applied watermark doesn't actually come in the form of an audio layer you load from a different file, but rather compiled based on input. This field needs to be filled in with binary values, while the number of additional bytes is shown. Additionally, you can include a 12-bit time stamp to the data payload. This type of watermark is applied on either a public layer, which anyone can easily read, or private layer, for which a HEX editor is required. Decoding is the reverse process, requiring a lot less effort. It's enough to load the target file, and specify the layer to extract, which can be public, private, or other custom layers based on specific code. In conclusion Taking everything into consideration, we can say that Eym Audio Watermark GUI is a straightforward tool with which you can secure your audio projects by injecting additional pieces of code which only you can recognize. Although it can only process one file at a time, the overall operation takes little time and effort from start to end. This move towards a U.S. unregulated gold and silver exchange is similar to the plan that Glencore International announced earlier this month. Their attempt, however, was simply to set up their own online gold and silver exchange. The difference between Goldcorp and Glencore is that Goldcorp wants to use physical silver and gold from the ground up and try to move the metals from mining to wholesale and retail. Glencore on the other hand wants to only use their online gold and silver exchange to move metals between the miners and the retail consumer. Why does this matter? The big advantage that Glencore has over Goldcorp is that they are not subject to anti-trust law as well as regulations that are imposed on the gold and silver exchanges in the United States. By adding to their physical gold and

silver based exchange, the government is finding that there will be less space for the brokers to manipulate the gold and silver prices. Glencore International has plans to open their exchange in Europe in the first half of 2014, but Goldcorp will be working to expand their exchange into the United States in the first half of 2014. So far, the gold and silver exchanges in the United States have made it difficult for the mining companies and the independent miners to access the market. The basis for this is that the precious metals are deemed to be a "commod
