One thing I'm learning with this program is that Elements is not a program for toy kids. It immediately offers tools to help you create seamless grid-like patterns, or zoom into a small area to crop out an object, and I can't seem to use them functionally enough to be happy with my results. I almost always find these options make the class much better than the school. The latest feature I'm especially excited about is the ability to create special effects in layers. I take my work seriously, and I'm desperately craving the ability to create special effects on bits of images. I used Photoshop's Mixer panel in past versions, but right now the more I use Photoshop Elements, the more I want to turn to Photoshop to create the effects I want to use. I also enjoy layers; I rarely need them in Elements. I love that the program includes a smart cropping function. It's perfect! I'm shocked to learn how rarely people crop images at all these days. That function is perfect for quickly cropping to interesting shapes. It doesn't crop to the white areas; it crops to the interesting parts—even the parts you don't want to delete. It's my favorite feature of Elements. Overall, I think that if this release is more or less a cleaned-up version of earlier, more basic editions, I'll consider that a success. As far as people with memory and technical needs not requiring as much crutch, I'll recommend this version. First impressions are great and CameraRAW reader support is solid. But, there's no way around it: Adobe needs to make Photoshop faster. I'm not Jony Ive, so I can't expect miracles; But they can take another five years to make much-needed improvements. And if they wanted to, they could have exactly like, say, FinalCut pro for a fraction of the price. But Adobe needs to realize that if they can't keep people by providing them with a product that is fast, reliable and feature-packed, they will lose thousands of existing users to the competition.
